Transformer² : Self-adaptive LLMs

Qi Sun*, Edoardo Cetin*, Yujin Tang* {qisun, edo, yujintang}@sakana.ai *Equal contribution

Fine Tuning and Adaptive LLMs

- Self-adaptive LLMs would let models adjust to tasks in real-time.
- Traditional training tries to optimize for all tasks at once but is inefficient.
- Expert modules could help but face issues with large number parameters, overfitting, and composition.

Transformer²

A self-adaptation framework that adapts LLMs for unseen tasks in real-time.

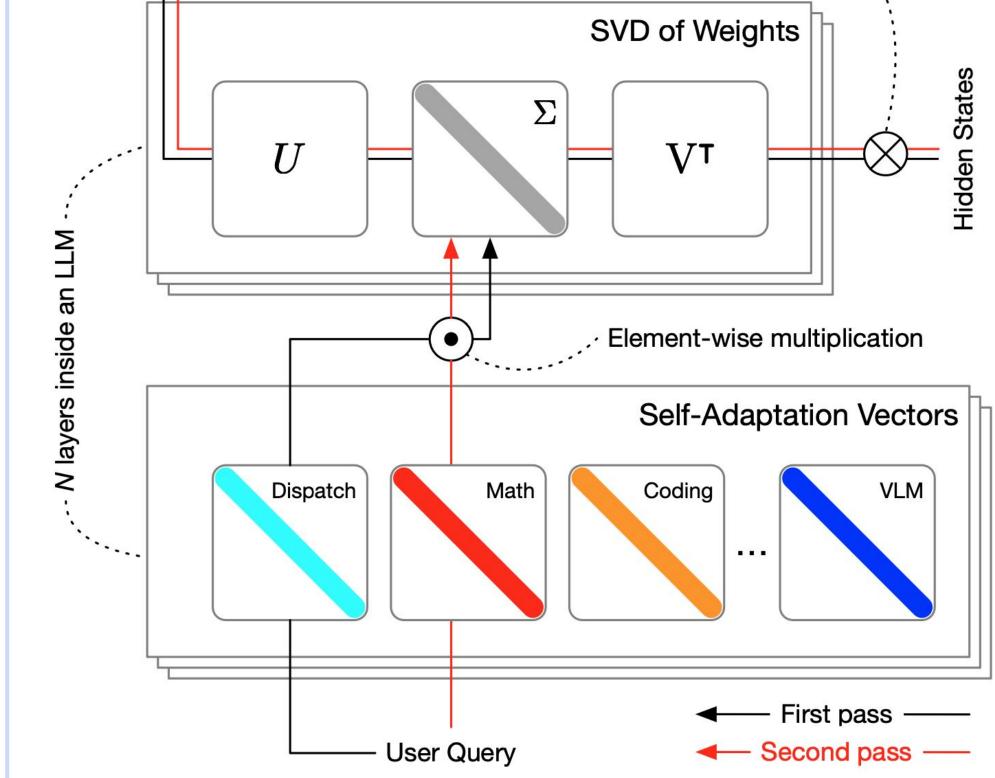

Result 1 - Seen Tasks

R

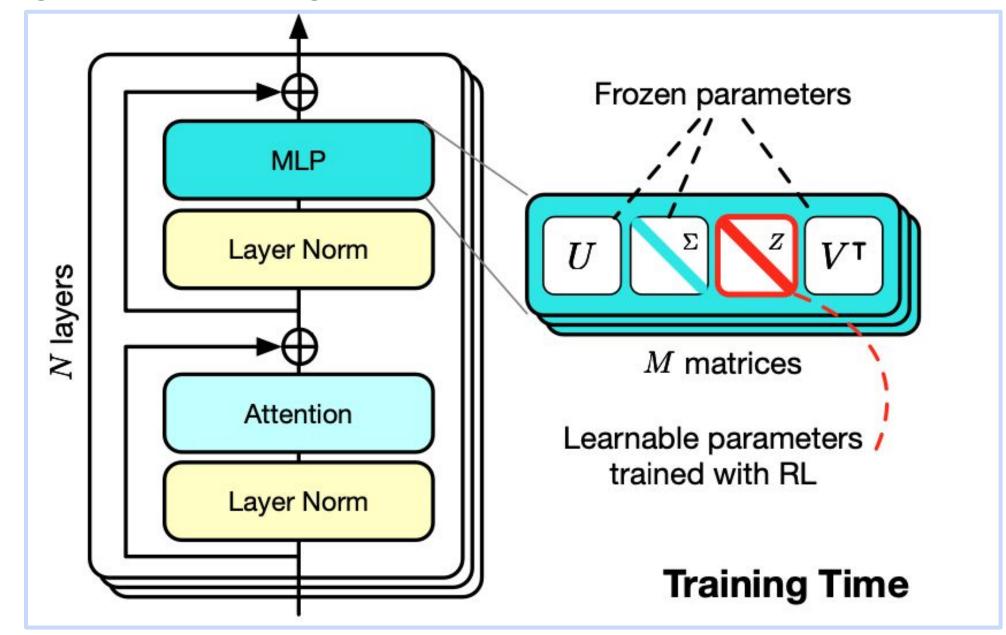

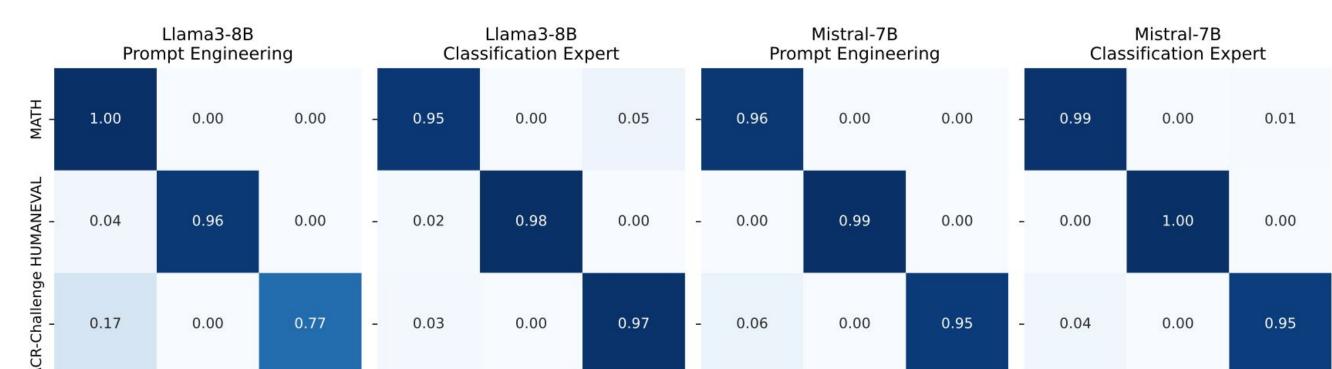

• Singular Value Finetuning

In training, we tune the scales of the singular values of the weight matrices to generate a set of "expert" vectors.

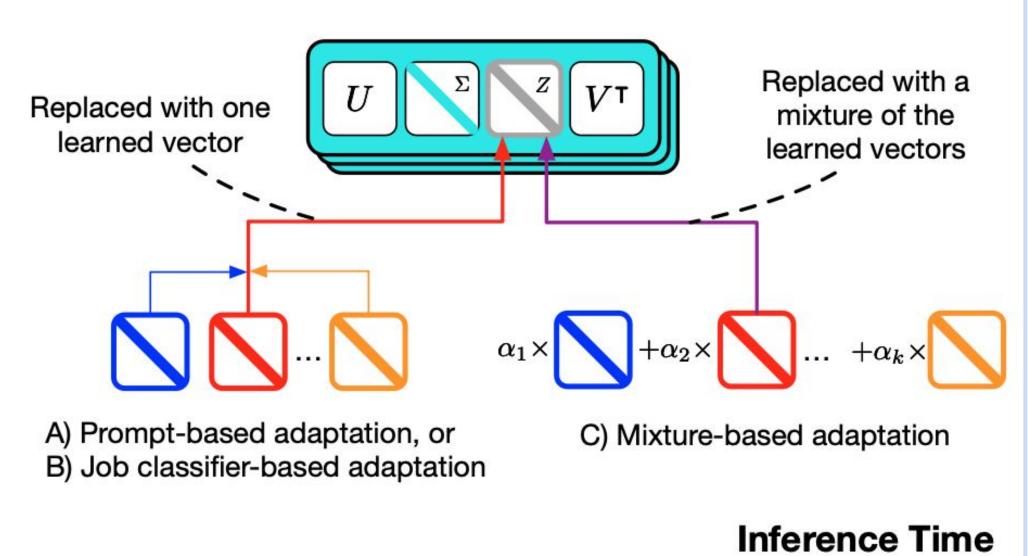

Method	MATH	Humaneval	ARC-Challenge

Analysis 1 - Job dispatching accuracy

• Adaptive Inference

In inference, a **two-pass** process is adopted where the first applies the task- specific expert and the second generates the answer.

Analysis 2 - Adaptation contribution

Analysis 3 - Cross-model compatibility

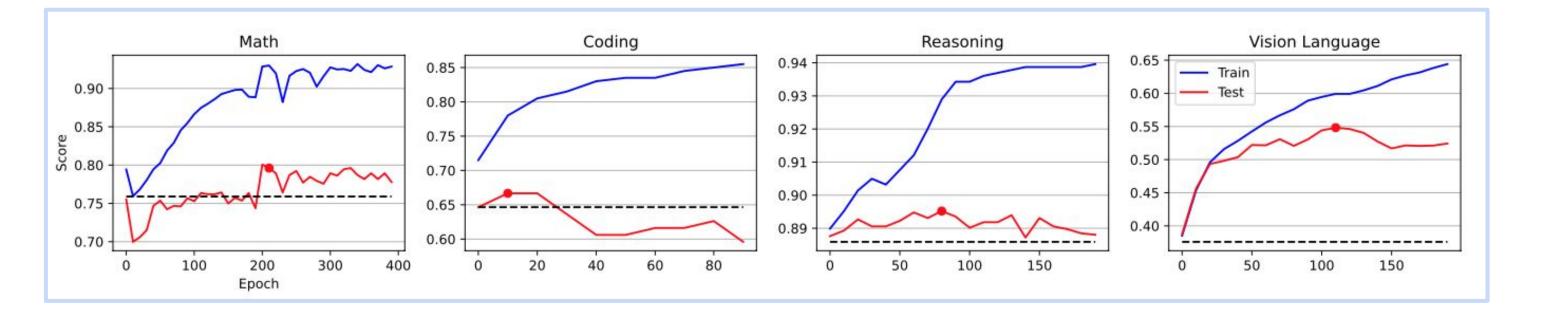

Method	MATH	Humaneval	ARC-Challenge
SVF training task	GSM8K	MBPP-pro	ARC-Easy
MISTRAL-7B-INSTRUCT-V0.3	13.02 (1.00)	43.29 (1.00)	71.76 (1.00)

Training Experts Vectors

Expert vectors are trained through reinforcement learning, using **KL-divergence** as a regularization technique.

- Reduces dependency on specific training datasets
- Allows direct task-specific feedback to improve model performance

$$J(\theta_z) = \mathbb{E}\left[\log\left(\pi_{\theta_{W'}}(\hat{y}_i \mid x_i)\right) r(\hat{y}_i, y_i)\right] - \lambda D_{\mathrm{KL}}(\pi_{\theta_{W'}} \| \pi_{\theta_W})$$

+ Llama SVF (ordered σ_i)	11.96 (<mark>0.92</mark>)	45.12 (1.04)	72.01 (1.00)
+ Llama SVF (shuffled σ_i)	10.52 (<mark>0.81</mark>)	40.24 (<mark>0.93</mark>)	70.82 (<mark>0.99</mark>)
+ Few-shot adaptation (cross-model)	12.65 (<mark>0.97</mark>)	46.75 (1.08)	75.64 (1.05)

Future Direction

- Explore model merging techniques to overcome the limitations of SVD experts' dependency on base models.
- Investigate ways to reduce computational costs when scaling to multiple specialized domains.
- Leverage advanced techniques to develop more powerful adaptation strategy.
